An Extract of a Letter from the Excellent Renatus Franciscus Slafus, Canon of Liege and Counfellor to his Electoral Highnels of Collen, written to the Publisher in order to be communicated to the R. Society; concerning his short and easie Method of drawing Tangents to all Geometrical Curves without any labour of Calculation: Here inserted in the same language, in which it was written.

Eshodum meam ducendarum ad Curvas quasilibet Geometricas Tangentium mitto ad Te, & Virorum Doctissimorum R. Societatis censure submitto. Brevis mihi visa est ac facilis, quippe quam puer à populitens doceri possit, & qua absque ullo calculi labore ad omnes omnino lineas extendatur: Malotamen aliis talem videri quam mihi, cum in rebus nostris cacutire plerumque soleamus.

Fig. 1. Data sit igitur qualibet Curva D. 2. cujus puncta omnia referanturad Rectam quamlibet datam E. A. B. per Rectam D. A.; sive E. A. B. sit diameter seu alia qualibet, sive etiam alia simul linea data sint, qua, vel

quarum potestates Aquationemingredianeur; parum id refert.

In: Equatione Analytica, facilioris
explicationis causa,
DA perpetud dicatur
v, BA, y. EB verd
or alia quantitates
data, Consonantibus exprimantur.

Tum supponatur ducta DC, tangens curvam in D, & occurrens EB, producta, stopus sit, in puncto C; & CA perpetuo quoque dicatur a. Ad inveniendam AC vel a, hac erit Regula Generalis:

1. Rejectis ab aquatione partibus, in quibus y vel v non invenitur; ft atuantur ab uno latere omnes in quibus est y, & ab altero illa in quibus babetur v, cum suis signis + vel —. Hoc, dextrum, illud, sinistrum latus, facilitatis causa, vocabimus.

2. Its latere dextro, prafigatur singulis partibus exponens potestatis quam in illu obtinet v; seu, quod idem est, in illum ducantur partes.

3. Fiat idem in latere sinistro, praponendo scil. unicuique illius parti Exponentem potestatis quam in illa habet y. Sed & hoc amplius: Unum y in singulus partibus vertatur in a.

Ajo, Æquationem sic reformatam modum oftendere ducenda Tangentis ad puntum D datum. Cù n enim eo dato, pariter data sint y & v, & catera quantitates, qua Consonantibus exprimuntur; a non poterit ignorari.

Si

Si quid forte sit obscuritatis in Regula, aliquot exemplis illustrabiture. Data sit hec Aquatio by -yy = VV; in qua EB sit b, BA, y, DA, v, & quaratur a sive AC talis, ut juncta DC tangat Curvam DQ in D. Ex regula, nihil rejiciendum est ab hac Aquatione, cum in singulis ejus partibus reperiatur y vel v. Ita quoque disposita est, ut ab uno latere sint omnes illim partes in quibus y; ab altero, omnes in quibus v. Singulis itaque tantum prasigendus est Exponens potestatis, quam in illis habet y vel v; & in latere sinistro unum y vertendum in a, ut siat ba = 2 y a = 2 v v. Ajo nunc, hanc Aquationem ostendere modum ducenda Tangentis ad punctum D, sive a = 2 v v = AC.

Sic si data subvite aquatio q q + b y - y y = v y; eadem planè sieret eum priori Equatio pro Tangente; abjecto scil. q qut Regula prascribit. Sic ex $2byy - y^3 = v^3$ sit $4bya - 3yya = 3v^3$ sive $a = \frac{5v^3}{4by - 3yy}$: $Ex bby + zyy + y^3 = qvv$, sit bba + zzya + 3yya = 2qvv $6x = \frac{2qvv}{2b^2+2z^2}$; $Ex b^4 + by^3 - y^4 = qqvv + zv^3$, sit $3 \ge y y = 4y^3 = 2qqvv + 3zv^3$ $6x = \frac{2qqvv}{30yy - 4y^3}$.

Verim in similibus aquationibus nullam arbitror accidere posse difficultuicm. Aliqua fortasse in illus occurret, quarum partes quadam constant ex productis y in v: Ut y v, y y v & y v v, & c. Sed hac quoque levis est, ut exemplis patebit. Detur enim y = b v v _ y v v. Nihil ab illa rejiciendum erit, cum in singulis ejus partibus reperiatur y vel v.

Sed ut ex Regulæ prascripto disponatur, bis sumendum erit y v v, esstatuendum tam in latere dextro, in quo sunt partes quæ habent v, quàm in sinistro, cujus partes kabent y; quandoquidem y v v, tam y quàm v contineat. Faciendum igitur erit

y * f v v y = b v v - y v v.

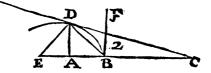

Turn mutatâ, ut prins, hac aquatione in aliam 3 y y a \dagger v v a = 2 b v v \sim 2 y v v, dabitur a = $\frac{2 \cdot 5 \cdot 5 \cdot 27 \cdot 7}{3 \cdot 7 \cdot 7 \cdot 7}$.

Atque his Exemplis arbitror, me omnem, que dari posset, Casuum varietatem complexam esse. Ceterum non erit fortasse inntile, si ea que generatim exposui, aa lineam aliquam singularem applicem. Data sit égitur Curva BD, cusus ea sit proprietas, ut sumpto in illa quolibet puncto D, si jungatur BD, & erigatur ad illam normalis DE, occurrens reche BE in E, resta DE sit semper equalis date resto BF. Ut habeatur

babeatur Aquatio in terminis Analyticis, sit DA = v, BA = y, BF Fig.2 wel DE = q. Erit itaque $EA = \frac{v}{\gamma}$. Et chm quadratum DE aqualo sit duobus DA, AE; erit aquatio $qq = \frac{v^4}{\gamma^2} + vv$; sive $qqyy = v^4 + yyvv$; qua pro Tangente, ex Regula prascripto, sic reformanda erit, $qqyy - vvyy = v^4 + yyvv$ $2qqya - 2vvya = 4v^4 + 2yyvv$

 $a = \frac{4 \cdot 4 + 2 \cdot y \cdot y \cdot v}{2 \cdot q \cdot q \cdot y \sim 2 \cdot v \cdot y}.$

Quomodo autem Æquationes hujusmodi ad faciliores terminos pro constructione reduci debeant, id sanè solertem Geometram minime latebit. Ut ecce in hoc Exemplo.

quoniam Rectangulum BAE supponitur aquale Quadrato AD, si EA dicature, crit vv=ye, evv=yee, e

Caterum, quoniam hactenus supposuisse videmur, Tangentem versus partes B ducendam esse, cum tamen ex datis accidere possit, ut vel parallela sit ipsi AB, vel etiam ducenda ad partes contrarias; definiendum nunc superest, quomodo hac Casuum divensitas in Agnationibus distinguatur, Fatta igitur Frattione pro a,ut in Exemplis supra adductis, consideranda sunt partes tam Numeratoris quam Denominatoris, & earum signa.

1. Nam si in utroque, partes vel habeant omnes signum†, vel sáltem

Assirmata pravaleant Negatis, ducenda erit Tangens versus B.

2. Si Affirmata pravaleant Negatis in Numeratore, sed aquales sint in Denominatore, recta per D ducta, parallela A B tanget Curvam in D: hoc enim in casu, a est infinita longitudinis.

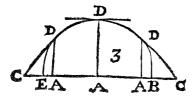

3. Si tam in Denominatore, quam Numeratore, partes Affirmata minores sint negatis; mutatis omnibus signis, ducenda erit rursus Tangens versus B: hic enim casus cam primo in idem recidit.

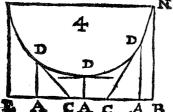

4. Si in Denominatore pravaleant, in Numeratore minores sint, vel contra; mutatis signis illius in quo sunt minores, ducenda erit Tangens

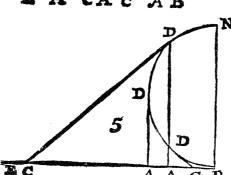

versus partes contrarias, b.e. AC sumenda erit versus E.

5. As tandem si in Numeratore partes Assirmate sint equales Negatis, quomodocungs se habeant in Denominatore, a abibit in nihilum. Itaqquel ipsa AD erit Tangens, vel ipsa EA, aut ei parallela; quod ex datis facilè dignoscitur. Horum autem Casuum varietus explicari potest per Æquationes ad circulum.

Vid. Fig. 3. Sit enim Semi-circulus, cujus diameter EB, & in eo punodum D datum, ex quo cadat normalis DA=v. Sit BA=v. BE=b:

erit aquatio b y -y y = v v, & dultà Tangente DC, erit AC sive a $\frac{21}{3}$. Nunc se b major sit 2 y, ducenda est tangens versus B: si aqualis, sit parallela EB; sin autem minor, ducenda est versus E; ut n. 1. 2. & 4. diximus.

Vid. Fig. 4. Detur rurfus alius Semi-circulus inversus, cujus puncta referri intelligantur ad Restam diametro parallelam, & eidem aqualem, ut in schemate. Denomi natis, ut prius, partibus, & $\mathbf{N}^{NB}=\mathbf{d}$, fit equatio by -yy = dd + vv - 2 dv. Igitur A C sive a = 2vv-2dv. Cum verò in exemplo supposuerimus, v semper ese minorem d; fi b sit major 2 y, ducenda erit Tangens versus E; si aqualis, erit parallela; sin minor, mutatis omnibus signis, ducenda erit versus b; at n.4.5.6 3.

Nulla autem ducenda effet Tangens, seu Tangens foret ipsa EB, si supposuissemus NB aqualem semi-diametro, sive 2 d = b; ut n. 5.

V. Fig. 5. Sit tandem alius Semi-circulus, cujus diameter NB normatis sit ad restam BE, ad quam ejus puncta referri intelligantur. NB dicatur b, & alia partes denominentur ut suprà; siet Aquatio yy = bv-vv; & $a=\frac{bv-2vv}{2\gamma}$. Sam si b sit major 2 v, Tangens ducenda erit versus B; si minor, versus E; si autem aqualis, ipsa DA erit Tangens; ut n. 1.4. & 500.

Et hac est, ni fallor, Casuum omnium varietas, qua ex Aquationum

onsideratione deprehendi potest.

Quomodo verò ex doctrina Tangentium constituantur Aquationum Limites, non est ut pluribus exponam, cum evidens esse existimem, maximam vel minimam applicatarum vel utramque simul determinari di Tangente parallela: de quo & aliàs ad Te scripsi, & aliquid etium attigi Miss. Miscelaneorum capiubi &, quâratione slexus contrarii curvarum ex Tangentibus inveniantur, ostendi. Eadem ratione reperitur quoque un axis xòps, ut vocat Pappus, & multa alia; que si explicare vellem, liber mihi scribendus esset. Nam & in Physico-mathematicis Usus quoque bujus Regula opinione major est: Licèt enim falsum sit Axioma, Naturam agere per lineam brevissimam; verissimum tamen est, Viam sequi determinatam. &, ubi nullam invenit, agere dosisos. De quo alias plura, si tanti Tibi visum fuerit: jam enim epistola modum excessi ac vereor, ne, dum obscuritatem vitare satago, in prolixitatem inciderim. Addo tantum, me Regula mea Demonstrationem * habere facilem, & que solis constet Lemmatibus; quod mirum Tibi fortasse videbitur. Vale. Dabam Leodii d. 17. Januar. CIDIOCLXXIII.

*Non dubitamus, quin rogatu nostro Illustris & Candidus hic Author Demonstrationem hic indigitatam Nobis etiam brevi sit communicaturus.

An Accompt of some Books.

I. A Discourse concerning the Origin and Properties of WIND, &c. By R. Bohun Fellow of N. Coll. in Oxon. Printed at Oxford 1671. in 8°.

He Industrious Author of this Discourse, having consider'd with himself, how little Progress had been made, as in general, in the History of Nacure, so, in particular, concerning the History of Winds, till our Voyages to the East and West-Indies, and the great advancement of Navigation in this and the precedent Age, furnish't us with so many new Discoveries and Improvements in all Natural knowledge, especially in the Motions of the Winds and Seas, that we must acknowledge the Insufficien. cy of the Theories received from the Schools of the Antients; having, I fay, considered this, and withall met with frequent opportunities of conversing with the most Experienced of our Sea-Captains, giving him good information of the Course of the Trade-winds, the Indian Monzoons, the several forts of Brises in the African and American Climates, Hurricans, and other tempestuous Winds: Endeavoureth in this Discourse to give a suller Accompt of this Subject than former Writers have done, proceeding therein, as he assureth the Reader, with great caution, in feldom making use of any Account of Voyagers, but when several Relations did agree in the same Particulars, or when he S5355
